1.0. Introduction

The ACR1222L NFC Reader with LCD is a PC-linked device that is used for accessing contactless cards. Its contactless interface is used to access ISO 14443-4 Types A and B cards, Mifare, FeliCa and ISO 18092 or NFC tags. ACR1222L also has a Secure Access Module (SAM) interface that ensures a high level of security in contactless smart card applications.

ACR1222L serves as an intermediary device between the PC and the smart card. The reader is connected to the PC via its USB port and carries out the PC's commands--whether the command is used in order to communicate with a contactless tag or SAM card, or control the device peripherals (LCD, LED or buzzer). This API document provides a detailed guide on implementing PC/SC APDU commands for device peripherals and contactless tags following the PC/SC Specifications.

2.2. Communication between the PC/SC Driver and the PICC & SAM

The protocol between the ACR1222L and the PC is using CCID protocol. All the communication between PICC and SAM are PC/SC compliant.

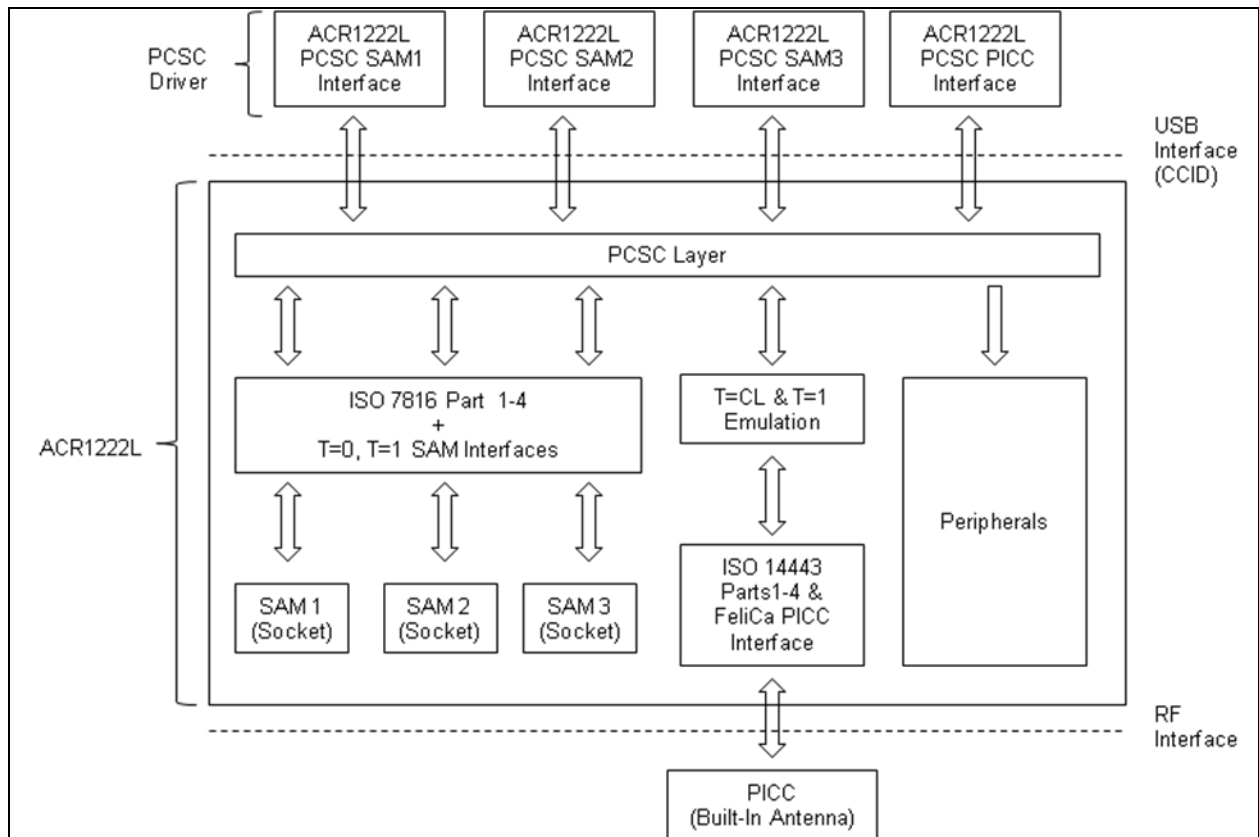

Figure 2: ACR1222L Architecture

3.0. Hardware Design

3.1. USB

The ACR1222L connects to a computer through a USB following the USB standard.

3.1.1. Communication Parameters

The ACR1222L connects to a computer through USB as specified in the USB Specification 2.0. The ACR1222L is working in full speed mode, i.e. 12 Mbps.

Pin	Signal	Function
1	V _{BUS}	+5V power supply for the reader
2	D-	Differential signal transmits data between ACR1222L and PC.
3	D+	Differential signal transmits data between ACR1222L and PC.
4	GND	Reference voltage level for power supply

Table 1: USB Interface Wiring

Note: In order for the ACR1222L to function properly through USB interface, the device driver should be installed.

3.1.2. Endpoints

The ACR1222L uses the following endpoints to communicate with the host computer:

Control Endpoint	For setup and control purpose
Bulk OUT	For command to send from host to ACR1222L (data packet size is 64 bytes)
Bulk IN	For response to send from ACR1222L to host (data packet size is 64 bytes)
Interrupt IN	For card status message to sent from ACR1222L to host (data packet size is 8 bytes)

3.2. Contact Smart Card Interface

The interface between the ACR1222L and the inserted smart card follows the ISO 7816-3 specifications with certain restrictions or enhancements to increase the practical functionality of the ACR1222L.

3.2.1. Smart Card Power Supply VCC (C1)

The current consumption of the inserted card must not be any higher than 50 mA.

3.2.2. Card Type Selection

Before activating the inserted card, the controlling PC always needs to select the card type through the proper command sent to the ACR1222L. This includes both memory card and MCU-based cards.

For MCU-based cards the reader allows to select the preferred protocol, T=0 or T=1. However, this selection is only accepted and carried out by the reader through the PPS when the card inserted in the reader supports both protocol types. Whenever a MCU-based card supports only one protocol type, T=0 or T=1, the reader automatically uses that protocol type, regardless of the protocol type selected by the application.

3.2.3. Interface for Microcontroller-based Cards

For microcontroller-based smart cards only the contacts C1 (VCC), C2 (RST), C3 (CLK), C5 (GND)

and C7 (I/O) are used. A frequency of 4 MHz is applied to the CLK signal (C3).

3.3. Contactless Smart Card Interface

The interface between the ACR1222L and the Contactless follows the ISO 14443 specifications with certain restrictions or enhancements to increase the practical functionality of the ACR1222L.

3.3.1. Carrier Frequency

The carrier frequency for ACR1222L is 13.56 MHz.

3.3.2. Card Polling

The ACR1222L automatically polls the contactless cards that are within the field. ISO 14443-4 Type A, ISO 14443-4 Type B and Mifare, FeliCa and NFC tags are supported.

3.4. User Interface

3.4.1. Buzzer

A monotone buzzer is used to show the “Card Present” and “Card Removal” events.

User-controllable Monotone Buzzer.

Events	Buzzer

2. Card Present Event (PICC)	Beep
3. Card Removal Event (PICC)	Beep

4.1.2.4. Access PC/SC Compliant Tags (ISO 14443-4)

Basically, all ISO 14443-4 compliant cards (PICCs) would understand the ISO 7816-4 APDUs. The ACR1222L Reader needs to communicate with the ISO 14443-4 compliant cards through exchanging ISO 7816-4 APDUs and Responses. ACR1222U will handle the ISO 14443 Parts 1-4 Protocols internally.

The Mifare 1K, 4K, MINI and Ultralight tags are supported through the T=CL emulation. Just simply treat the Mifare tags as standard ISO 14443-4 tags. For more information, please refer to topic "PICC Commands for Mifare Classic Memory Tags".

Command

In which,

The Application Data of ATQB = 00 00 00 00, protocol information of ATQB = 33 81 81. It is an ISO14443-4 Type B tag.

Step 2: Send an APDU, Get Challenge.

<< 00 84 00 00 08

Hint: For ISO 14443-4 Type A tags, the ATS can be obtained by using the APDU "FF CA 01 00 00h."

Example: ISO 7816-4 APDU

To read 8 bytes from an ISO 14443-4 Type B PICC (ST19XR08E)

APDU = { 80 B2 80 00 08h }

Appendix A. Basic Program Flow for Contactless Applications

Step 0. Start the application. The reader will do the PICC Polling and scan for tags continuously. Once the tag is found and detected, the corresponding ATR will be sent to the PC.

Step 1. Connect the ACR1222L PICC Interface with T=1 protocol.

Step 2. Access the PICC by exchanging APDUs.

..

Step N. Disconnect the ACR122L PICC Interface and close the application.

Appendix B. Access PCSC Compliant Tags (ISO 14443-4)

All ISO 14443-4 compliant cards (PICCs) would understand the ISO 7816-4 APDUs. The ACR1222L needs to communicate with the ISO 14443-4 compliant cards through exchanging ISO 7816-4 APDUs and Responses. ACR1222L will handle the ISO 14443 Parts 1-4 Protocols internally.

Mifare 1K, 4K, MINI and Ultralight tags are supported through the T=CL emulation. Just simply treat the Mifare tags as standard ISO 14443-4 tags. For more information, please refer to topic “PICC Commands for Mifare Classic Memory Tags.”

ISO 7816-4 APDU Command

ISO 7816 Part 4 Command					Length of the Data In		Expected length of the Response Data

ISO 7816-4 Response

Response	Data Out		
Result	Response Data	SW1	SW2

Where:

SW1, SW2 = 90 00h means the operation is completed successfully
= 63 00h means the operation failed

Typical sequence may be:

- Present the Tag and Connect the PICC Interface.
- Read/Update the memory of the tag.

Step 1: Connect the Tag.

The ATR of the tag is 3B 8C 80 01 50 57 26 34 D9 1C 2D 94 11 F7 71 85 76

In which,

The ATQB = 50 57 26 34 D9 1C 2D 94 11 F7 71 85. It is an ISO14443-4 Type B tag.

Step 2: Send an APDU, Get Challenge.

<< 00 84 00 00 08

>> 44 70 3D A2 6C DA 43 D5 [90 00]

Note: For ISO 14443-4 Type A tags, the ATS can be obtained by using the APDU “FF CA 01 00 00h”

Example: ISO 7816-4 APDU

To read 8 bytes from an ISO 14443-4 TypeA PICC.

APDU = {80 B2 80 00 08h}

Class = 80h

INS = B2h

P1 = 80h

P2 = 00h

Lc = None

Data In = None

Le = 08h

Answer: 01 02 03 04 05 06 07 08h [90 00h]

Appendix C. Access DESFire Tags (ISO 14443-4)

The DESFire supports ISO 7816-4 APDU Wrapping and Native modes. Once the DESFire Tag is activated, the first APDU sent to the DESFire Tag will determine the “Command Mode”. If the first APDU is “Native Mode”, the rest of the APDUs must be in “Native Mode” format. Similarly, if the first APDU is “ISO 7816-4 APDU Wrapping Mode”, the rest of the APDUs must be in “ISO 7816-4 APDU Wrapping Mode” format.

Example 1: DESFire ISO 7816-4 APDU Wrapping.

To read 8 bytes random number from an ISO 14443-4 Type A PICC (DESFire)

APDU = {90 0A 00 00 01 00 00h}

Class = 90h; INS = 0Ah (DESFire Instruction); P1 = 00h; P2 = 00h

Lc = 01h; Data In = 00h; Le = 00h (Le = 00h for maximum length)

Answer: 7B 18 92 9D 9A 25 05 21h [\$91 AFh]

Note: Status Code {91 AFh} is defined in DESFire specification. Please refer to the DESFire specification for more details.

Example 2: DESFire Frame Level Chaining (ISO 7816 wrapping mode)

In this example, the application has to do the “Frame Level Chaining”.

To get the version of the DESFire card:

Step 1: Send an APDU {90 60 00 00 00h} to get the first frame. INS=0x60h

Answer: 04 01 01 00 02 18 05 91 AFh [\$91 AFh]

Step 2: Send an APDU {90 AF 00 00 00h} to get the second frame. INS=0xAFh

Answer: 04 01 01 00 06 18 05 91 AFh [\$91 AFh]

Step 3: Send an APDU {90 AF 00 00 00h} to get the last frame. INS=0xAFh

Answer: 04 52 5A 19 B2 1B 80 8E 36 54 4D 40 26 04 91 00h [\$91 00h]

Example 3: DESFire Native Command.

We can send Native DESFire Commands to the reader without ISO 7816 wrapping if we find that the Native DESFire Commands are easier to handle.

To read 8 bytes random number from an ISO 14443-4 Type A PICC (DESFire)

APDU = {0A 00h}

Answer: AF 25 9C 65 0C 87 65 1D D7h [\$1D D7h]

In which, the first byte “AFh” is the status code returned by the DESFire Card.

The Data inside the blanket [\$1D D7h] can simply be ignored by the application.

Example 4: DESFire Frame Level Chaining (Native Mode)

In this example, the application has to do the “Frame Level Chaining”.

To get the version of the DESFire card:

Step 1: Send an APDU {60h} to get the first frame. INS=60h

Answer: AF 04 01 01 00 02 18 05h [\$18 05h]

Step 2: Send an APDU {AFh} to get the second frame. INS=AFh

Answer: AF 04 01 01 00 06 18 05h [\$18 05h]

Step 3: Send an APDU {AFh} to get the last frame. INS=AFh

Answer: 00 04 52 5A 19 B2 1B 80 8E 36 54 4D 40 26 04h [\$26 04h]

Note: In DESFire Native Mode, the status code [90 00h] will not be added to the response if the response length is greater than 1. If the response length is less than 2, the status code [90 00h] will be added in order to meet the requirement of PC/SC. The minimum response length is 2.
